Custom Workflow/Custom Permissions			•

iPCR: Feature Descriptions

Unlimited Tags per iPad: Many companies will measure against your volume to determine a pricing scale. With unlimited tags with the iPCR there are no overages or adjustments.

Phone/Web Support: All packages include technical support via phone and email. Call as many times as you need to with no cap on the number of calls you can make. Toll-Free call-in number to U.S. based support representatives.

Phone/Web Training: All packages include product training. Personalized onsite training is also available for an additional cost.

Web Administrator Licenses: Web administration allows the company to develop their customizations and setup the program from your standard PC. The web administrator can also flag PCRs for later CQI or auditing needs.

Remote Service Storage of PCRs: All your PCRs are stored remotely and securely on our servers. This ensures you will never lose a PCR.

Hospital Faxing Module: The built in faxing module allows you to instantly fax the completed PCR.

Attachments & Signatures: iPCR allows the user to take images via the iPad's built-in camera. Customer's may also have PDF files built into the software integrated with the data included in the PCR. A customer can sign a document directly on the iPad's touch screen.

Messaging Center: Messaging may be used by supervisors to email employees in private or for interoffice communications.

Custom Field Creator: Edit information directly from the web interface including units of measure, adding new choices, inputting employees, and more.

Repeat Patient Speed Setup: For those companies who may have 'frequent fliers' or regular patient calls, easily recall stored data and have a leg up on PCR entry.

Shift Management & Signature Storage: Prior to a shift you can assign employees to that route. Staff's signatures will be stored so no need to sign each PCR or manually type in the EMT on call.

Cloud Based Updating: No more need for costly deployments, updates, or IT support. Any updates from the administrator are pushed out remotely, and an update applied when the employee logs into iPCR. Program updates are applied via a simple download from the App Store.

CQI: Accurate data is essential when submitting a PCR. Continuous Quality Improvement enable the administrator to review medics PCRs and flag core data for review. The medic will then be notified on the iPad of said PCR and will correct all fields and resubmit.

Web Reporting: The administrator can pull any report they need with our customized templates built into the web based module. Simply click reports and choose from one of our included samples or create

iPCR: Feature Descriptions

Integration Adapter: This activates the application portal to allow iPCR to be linked with a wide variety of products. Items able to be integrated are monitors, CAD systems, and billing software. This is a fantastic way to save time, reduce errors, and eliminate redundancy. There are additional costs for linking items to the Integration Adapter.

Direct Billing Submission: PCRs can be submitted directly to a Billing company of your choice. These submissions can be submitted on a per PCR basis or submitted as a batch entry manually or automatically.

Bump Technology: A core component for first responders, Bump enables the synchronization of data across iPads instantly. Simply tap two bump-enabled iPads together and the First Responder can transfer his data to the arriving medic on scene.

Finish Anywhere PCR: PCRs can be finished back the station via the web based PCR program. Simply login to the web administration and launch the PCR creation/editing module.

Pre-Billing Module: Pre-billing allows the user to review finalized PCRs prior to submitting them to the Billing company. The goal is to identify and fix errors on the PCR prior to submission, increasing collection percentages. This feature can be turned on or off by the user.

Custom Workflow/Custom Permissions: Create custom security roles for your users as well as manage the flow of the PCR from start to finish.
